

Chapter 5 **Appendix**

Local Environmental Quality and Happiness in Mega Cities: Additional Regression Models

As noted in the main text of the chapter, we estimate several variations of our principal model, plus a reduced-choice model that has a stronger causal interpretation but includes a much more limited range of environmental data.

Four variations of the main model are presented in Table A4. These arise from the combination of two treatments: first, whether or not we include local-area (MSOA) fixed effects; and second, whether or not we interact all environmental characteristics with being outdoors. The inclusion of local-area fixed effects makes little difference to the results, which is encouraging for the robustness of our findings. The interaction of environmental characteristics with being outdoors is important, however. In the absence of the interaction, there are few significant effects. Presumably this is because weather, green space, and so on do not strongly affect people in the indoor environments in which they spend most of their time. By contrast, most environmental characteristics do show significant effects in interaction with being outdoors, where people experience them more directly. The discussion in the main text is focused on Model 4 in Table A4, which has both local-area fixed effects and environmental characteristics interacted with being outdoors.

Our ‘low-choice’ model is presented in Table A5. In terms of environmental characteristics, it includes only weather conditions and average air pollution concentrations, measured at the level of the city as a whole. We take weather observations from a single weather station (London Heathrow airport) at the nearest available time and within two hours before/after the response, and we link each response with London Air Quality Network (LAQN) estimates of background NO₂ and PM10 concentrations across London as a whole for the relevant date and hour. We deliberately exclude other environmental characteristics, such as green space, and other controls, such as activity and location, over which individuals have a high degree of choice. An element of choice, however, remains – individuals might choose to escape the city entirely, or wear a face mask to filter out

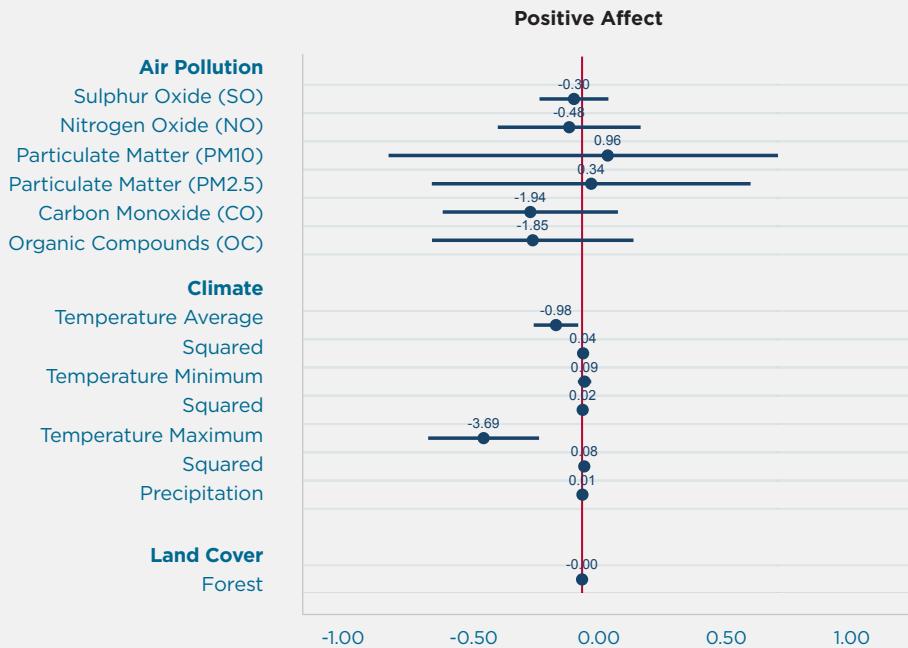

pollution, for example – but the effects estimated in the low-choice model should nevertheless bear somewhat stronger causal interpretation.

Weather effects in the low-choice model are very similar to those of the main models that interact weather conditions with being outdoors, but with the effect sizes somewhat reduced, as we might expect. Happiness is increased, and by increasing margins, by cloudless skies, partial sun, and continuous sunshine. The latter adds almost one percentage point of happiness compared to no sun at all. Happiness is also higher by just over one percentage point when the air temperature exceeds 25°C compared to temperatures below freezing. Happiness falls slightly as wind speeds rise, so that at 15 knots or more, happiness is slightly over half a percentage point lower than in still conditions. The effects of daylight and rain are not significantly different from zero in this specification.

As regards air quality, in the low-choice model low NO₂ is associated with a modest increase in reported happiness: responses subject to the lowest pollutant concentrations (the bottom 5%) are 0.34 percentage points happier than those at the middle quartiles, and those subject to low concentrations (the next 20%) are 0.16 percentage points happier. This is a small but meaningful boost in well-being. Neither low nor high concentrations of PM10 are seen to affect happiness at the 5% significance level (though there does appear to be a modest *upward* trend with increasing concentration, which is not intuitive). Note that the NO₂ and PM10 variables are not strongly correlated, and results obtained when they are entered separately in their own regressions (not shown) differ little from these ones.

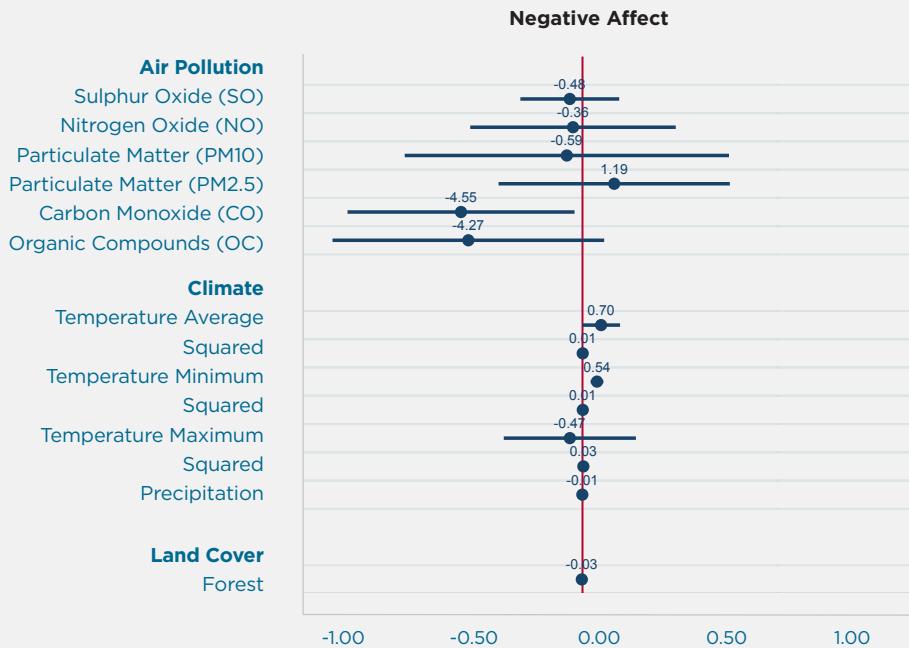

Table A7 presents some additional regression estimates supporting Chapter 1. In this model, which is run for the full sample (not just Greater London responses), all activities are interacted both with being with friend(s) and with being with a partner.

Figure A1: How Environmental Quality Affects Positive Affect Around the World

Notes: Plotted coefficients are obtained from separate models regressing positive affect on each environmental factor alongside controls at the individual, household, and country level. See Table A2 in this Appendix for the full regression table. Confidence bands are 95%.

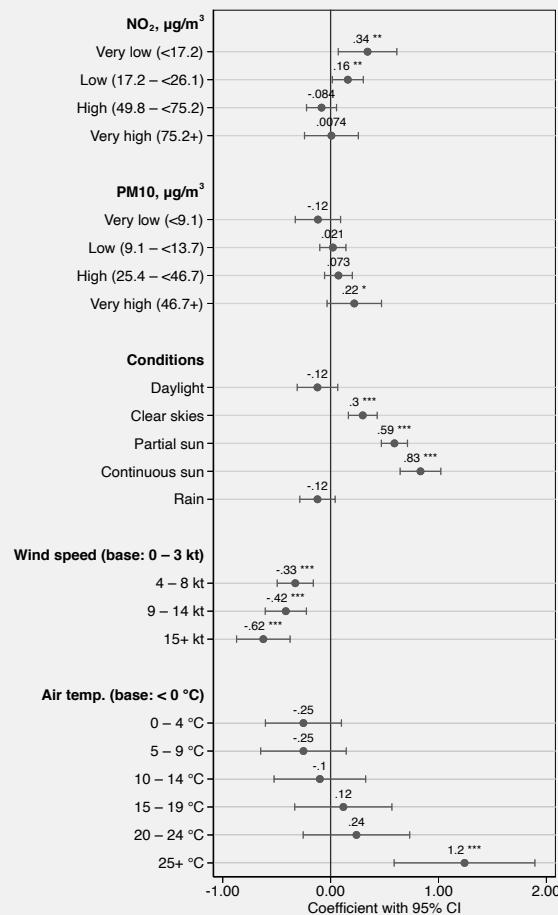

Sources: Gallup World Poll, 2005 to 2015; OECD Environmental Database; World Bank and World Bank Climate Change Knowledge Portal.

Figure A2: How Environmental Quality Affects Negative Affect Around the World

Notes: Plotted coefficients are obtained from separate models regressing negative affect on each environmental factor alongside controls at the individual, household, and country level. See Table A3 in this Appendix for the full regression table. Confidence bands are 95%.

Sources: Gallup World Poll, 2005 to 2015; OECD Environmental Database; World Bank and World Bank Climate Change Knowledge Portal.

Figure A3: Happiness Impacts of Air Quality and Weather Conditions in Greater London, UK: Low-Choice Model

Notes: Plotted coefficients are obtained from a single model (see Table A4), regressing reported happiness (scaled 0 – 100) on all environmental factors, alongside date and time controls and individual fixed effects.

Sources: Happiness data set; London Air Quality Network; UK Met Office.

Confidence bands are at the 95% level.

Very low (<5.5) x outdoors	0.39	1,936
Low (5.5 – <8.1) x outdoors	1.8	9,000
High (17.1 – <38.4) x outdoors	2.08	10,434
Very high (38.4+) x outdoors	0.58	2,887
Noise		
Quiet	21.74	108,993
Loud	23.38	117,224
Quiet x outdoors	0.52	2,608
Loud x outdoors	2.57	12,897
Conditions		
Daylight	78.91	395,582
Clear skies	8.65	43,354
Rain	9.61	48,185
No sun	57.34	287,476
Partial sun	29.81	149,439
Continuous sun	12.85	64,410
Daylight x outdoors	7.9	39,588
Clear skies x outdoors	0.94	4,704

Table A6. Descriptive Statistics: Environmental Characteristics of Mappiness Observations, Greater London (continued)

Binary variable	Proportion of observations (%)	Number of observations
Rain x outdoors	0.64	3,215
No sun x outdoors	4.51	22,586
Partial sun x outdoors	3.25	16,313
Continuous sun x outdoors	1.61	8,063
Wind speed		
0 - 3 kt	9.95	49,894
4 - 8 kt	41.68	208,963
9 - 14 kt	40.22	201,613
15+ kt	8.15	40,855
0 - 3 kt x outdoors	0.86	4,331
4 - 8 kt x outdoors	4	20,032
9 - 14 kt x outdoors	3.81	19,122
15+ kt x outdoors	0.69	3,477
Air temperature		
< 0 °C	2.84	14,253
0 - 4 °C	11.35	56,885
5 - 9 °C	22.9	114,783
10 - 14 °C	28.24	141,561
15 - 19 °C	26.68	133,766
20 - 24 °C	6.86	34,381
25+ °C	1.14	5,696
< 0 °C x outdoors	0.17	839
0 - 4 °C x outdoors	0.73	3,682
5 - 9 °C x outdoors	1.65	8,252
10 - 14 °C x outdoors	2.54	12,737
15 - 19 °C x outdoors	3.01	15,093
20 - 24 °C x outdoors	1.06	5,299
25+ °C x outdoors	0.21	1,060
Selected activities		
Walking, hiking	1.5	7,496
Sports, running, exercise	1.22	6,127
Gardening, allotment	0.19	974
Birdwatching, nature watching	0.14	686
Location		
Indoors	84.53	423,788
Outdoors	9.37	46,962
In a vehicle	6.1	30,575
Location		
At home	42.31	212,096
At work	32.4	162,446
Elsewhere	25.29	126,783

Notes: Statistics are reported here for all responses included in our preferred model specification (N = 501,325) as presented in Model 4, Table A4.
